

First, Next, Last

Putting steps in the right order

Name:

Date:

★ I can put steps in order: first, next, last.

Steps happen in order

When we do something, the steps happen in order: first, next, last. Bit is building a block tower — one block, then two, then three.

Watch Bit build — in order

First 1 block, next 2 blocks, last 3 blocks. The tower grows in order.

These steps are mixed up

1 Which step is FIRST?

The first step has the fewest dots. Circle the step that comes FIRST.

2 Which step is LAST?

The last step has the most dots. Circle the step that comes LAST.

3 You try — write the order

Write 1, 2, 3 under the mixed-up steps to put them in order (fewest to most).

--	--	--

Big idea

Doing steps in the right order — first, next, last — is how we follow a plan. A plan made of ordered steps is called an algorithm.

First, Next, Last

Quick facilitation notes & answer key

What this worksheet teaches

Children put the steps of an action in order — first, next, last — using cards with fewer or more dots. Putting steps in the right order is the start of a plan (an algorithm). No coding experience needed.

Before you start (no computer needed)

No computer — paper and a pencil or crayon. You read each prompt aloud; the child answers by circling or numbering. Optional: real objects or cards to put in order by hand first.

How to lead it (about 15 minutes)

1. Show them (you do). Line up cards with 1, 2, 3 dots: "fewest comes first, most comes last."
2. Do one together. Exercise 1 — the card with one dot comes first.
3. Let them try. Children do Exercise 2 (last), then Exercise 3 (number them 1, 2, 3).

Answer key (these are the verified correct answers)

Exercise 1 — circle the single-dot card (fewest = first). Exercise 2 — circle the three-dot card (most = last).

Exercise 3 — order is: one dot = 1, two dots = 2, three dots = 3.

If children get stuck — and ways to adjust

Watch for: ordering by where a card sits on the page, not by the number of dots. Count the dots together.

Make it easier: line up real objects from fewest to most by hand first.

Make it harder: add a fourth card (four dots) and order all four.

Make it active: have three children hold 1, 2, 3 dots and line themselves up.

Ontario Kindergarten link (official wording)

Problem Solving and Innovating — children order the steps of a familiar process.

In plain terms: putting the steps of an action in order — first, next, last.

No reading is needed from the child — you read each prompt aloud; the child answers by circling, numbering, or drawing arrows.

You'll know it worked when

The child orders the cards from fewest to most and labels them 1, 2, 3.
