

Fix by Swapping

A block points the wrong way

Name: _____

Date: _____

★ I can fix a block that points the wrong way.

Wrong way!

Sometimes a block points the **WRONG** way — a back block where it should be forward, or a forward block where it should be back. Run the code, find the wrong-way block, and **SWAP** it to fix the program.

Bit's number path

Program 1 — target is 4

start at 1

forward 2

back 1

1 Run it, find the wrong way

Run Program 1 from 1. Where does Bit land? It misses 4. Circle the block that points the **WRONG** way (it moves Bit away from 4).

2 Swap it

Change the wrong-way block so Bit reaches 4. What should it be? Run the fixed code — what number now?

Program 2 — target is 1

start at 3

forward 1

back 1

3 You try — swap to fix

Run Program 2 from 3. It misses 1. Circle the wrong-way block, swap it, and run again. What should the block be, and where does Bit land?

Big idea

If a block sends Bit the wrong way, swap its direction. Forward becomes back, or back becomes forward — then run it again to check.
