

Move Blocks

Quick facilitation notes & answer key

Goal

Children learn the move-block vocabulary of block coding: each arrow block makes the character travel in exactly one direction (➡ right, ⬅ left, ⬆ up, ⬇ down). Connecting a symbol to one precise action is the foundation for reading and writing programs in the next sheets.

Kindergarten frame (Ontario)

Problem Solving and Innovating — children use directional language and symbols to describe movement.

No reading required of the child: read each prompt aloud; the child circles a block or draws one arrow.

Materials

The printed worksheet and a pencil. Optional: a floor space to step the directions, or four arrow cards (➡ ⬅ ⬆ ⬇).

Run it (about 15 min)

1. MODEL: hold up each move block and act it out with your whole arm — '➡ right... ⬅ left... ⬆ up... ⬇ down.' One block, one way.
2. GUIDED: Exercise 1 — circle the ⬆ block (up). Exercise 2 — circle the ⬅ block (left).
3. YOU TRY: Exercise 3 — children draw a ⬇ arrow in the empty block to make Bit go down.
4. Connect: 'To tell a computer which way to go, you give it the block with that arrow.'

Answer key (modelled by the run-gate)

Ex 1 — UP is the ⬆ block (the arrow points up).

Ex 2 — LEFT is the ⬅ block (the arrow points left).

Ex 3 — DOWN is the ⬇ block: the child draws an arrow pointing straight down in the empty block.

Watch for & differentiate

Common mix-up: left ⬅ vs right ➡. Anchor to the child's own hands ('this is your LEFT hand') before they circle.

Simplify: do the arm movement together first, then point to the matching block.

Extend: call a direction and have the child point to the matching block as fast as they can.

Movement option: tape the four arrow cards to walls; call a direction, children walk that way.

Success looks like

The child circles the up and left blocks correctly and draws a downward arrow for 'down', showing each block stands for one specific direction.
