

Order Matters

Quick facilitation notes & answer key

Goal

Children meet the 1D board and the move arrow ➡, and see that the number of steps decides where Bit lands. This introduces an algorithm as a list of ordered steps carried out one at a time — the spine of the next three sheets.

Kindergarten frame (Ontario)

Problem Solving and Innovating — children carry out a short ordered sequence of moves.

No reading required of the child: read each prompt aloud; the child circles the landing box and writes a number.

Materials

The printed worksheet + a pencil. Optional: tape three boxes on the floor and walk Bit's steps.

Run it (about 15 min)

1. MODEL: point to box 1. 'One ➡ moves Bit to box 2. Another ➡ moves Bit to box 3 — the star.'
2. GUIDED: Exercise 1 together — one step lands on box 2.
3. YOU TRY: children do two steps (Ex 2 ➡ box 3), then count the steps to the star (Ex 3 ➡ 2).
4. Connect: 'Doing steps in order, one at a time, is how a computer follows an algorithm.'

Answer key (modelled by the run-gate)

Model — ➡ ➡ from box 1 lands on box 3 (the star).

Ex 1 — one ➡ ➡ box 2. Ex 2 — two ➡ ➡ box 3.

Ex 3 — Bit needs 2 steps (➡ ➡) to reach the star on box 3.

Watch for & differentiate

Common slip: counting the starting box as a move — the first ➡ is the first MOVE from box 1 to box 2.

Simplify: walk the steps on floor boxes before using the page.

Extend: add a box 4 and ask how many steps to reach it (3).

Movement option: children take one step per ➡ you call out and freeze on the landing box.

Success looks like

The child lands Bit on the correct box for one and two steps and counts that 2 steps reach the star.
